

ZINCLIKE : THE NEW BPIV SOLUTION

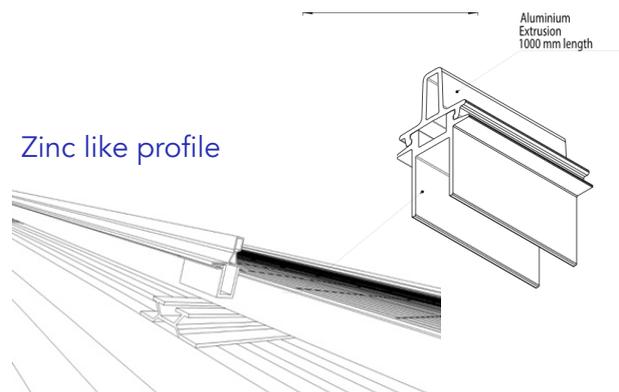

ABOUT THE TECHNOLOGY

We have created an architectural solution, integrated into the building and offering the aesthetics of a zinc roof to solar photovoltaic installations. Zinlike is not a waterproofing solution, it combines with proven roofing materials and techniques. This approach reconciles the expectations of all parties involved in a construction and/or renovation project. It preserves the ten-year guarantees of the specialists while reassuring the owners of the quality and durability of the materials. Each actor and component plays a specific role. Waterproofing is provided by the roofer, aesthetics and the production of renewable energy is provided by Skysun. Each has its own qualities and skills.

Our patented technology consists of a simple recycled aluminium profile that is fixed between the rows of panels. This creates the illusion of a zinc roof to the naked eye. (See 3D rendering above). The added value of our solution comes from the fact that it is "Low-Tech". It works with standard PV and construction components. The result: Competitive costs thanks to the low-tech approach, building on existing technologies.

Halle des abattoirs d'Anderlecht – 1890

Total power : 1.945 MWp
Number of solar panels: 5,808
Production : 1,653 MWh/year
Equivalent consumption : 703 households
CO2 emissions avoided : 754 Tonnes/year
